According to the Lowry-Bronsted definition, an acid is a proton donor and a base is a proton acceptor. According to the Lewis definition, acids are molecules or ions capable of coordinating with unshared electron pairs, and bases are molecules or ions having unshared electron pairs available for sharing with acids.

Categorize strong and weak acids and bases using chemical formula, pH data, or particulate drawings. Classify salts as acidic, basic, or neutral and connect to conjugate acids and bases. Relate the dissociation reaction and K value to strength of an acid or base. Calculate the pH of strong and weak acids and bases as well as salts.

In 1923, chemists Johannes Brønsted and Martin Lowry independently developed definitions of acids and bases

based on compounds abilities to either donate or accept protons ( $H^+$  ions). Here, acids are defined as being able to donate protons in the form of hydrogen ions; whereas bases are defined as being able to accept protons.

Substances with a pH between 0 and less than 7 are acids ( $pH$  and  $[H^+]$  are inversely related - lower pH means higher  $[H^+]$ ). Substances with a pH greater than 7 and up to 14 are bases (higher pH means lower  $[H^+]$ ). Right in the middle, at  $pH = 7$ , are neutral substances, for example, pure water.

The organic acids are weak in the sense that this ionisation is very incomplete. At any one time, most of the acid will be present in the solution as un-ionised molecules. For example, in the case of dilute ethanoic acid, the solution

The Brønsted-Lowry definitions of acids and bases are that acids are proton (hydrogen ion) donors and bases are proton acceptors. All Arrhenius acids and bases are included in the definitions of Brønsted-Lowry definitions, but there are some Bronsted-Lowry acids or bases that are not Arrhenius acids or bases. For example ammonia (NH

Proton donation and acceptance are dynamic processes for all acids and bases. Hence a proton transfer equilibrium is rapidly established in solution. •The equilibrium reaction is described in terms of conjugate acid/base pairs. •The conjugate base (CB) of a BL acid is the base which forms

Acids and bases both react with water and a lot of acids and bases are soluble in nature. Both acids and bases are electrolytes which means that they're good conductors of electricity. Acids and bases both produce ions in water solution. Acids release hydrogen ions ( $H^+$ ) whereas Bases release hydroxide ions ( $OH^-$ ).
